Calendars (and time itself) are functions of culture; informed by mathematics and astronomy, but shaped in their particulars by the overall understanding of cosmic, natural and social relationships underlying a community’s life. Some of us will date this Visions and Voices event as taking place on October 27, 2010 (Gregorian). Others may regard the day as being the 19th day of Cheshvan in the year 5771 (Hebrew), the 5th day of the 8th month in the year 1389 (Persian Jalali), the 3rd day of the 9th month of the 99th year of the Republic of China (Chinese lunar), the guisi day of the bingxu month (both by the 60-cyclical reckoning) of the Iron Tiger year in the 17th Rabjung (Tibetan), Dhu’l Qa’dah 19, 1431 (Islamic) or October 14, 2010 (Julian). Japan has long adopted the Gregorian calendar for months and days, but dates the year according to the year of the reigning Emperor, so this is the 27th day of the 10th month of Heisel 22. It is also the same month and day in North Korea, but this is the 99th year (dating from Kim Il-song’s birth year).

Out of This World Time

Livin’ on Titan Time

Imagine you have moved from Earth to Titan, Saturn’s largest moon. You have somehow gotten past the methane atmosphere and lakes and the seasons of cold/colder/really cold/frigid. How do you mark time? Titan is in synchronous rotation with Saturn, meaning that in the time it takes to rotate it also orbits Saturn (15 days, 22 hours in Earth time). From any given location on Titan, Saturn will remain in the same position in the sky, so a year or a day based on Titan’s relationship with Saturn would be meaningless. That still, however, does give you a measurement of a “day,” relative to the sun, that is just a bit longer than half an Earth month. How about the time it takes Titan (and Saturn) to orbit the Sun? That is 10,759 Earth-days (29.5 Earth years); an Earth-normal human lifetime should give you two or maybe three times around the sun; more practical for marking life stages than life events. Titan is in a 3:4 orbital resonance with Hyperion, another of Saturn’s moons. This means that in the time it takes Titan to orbit Saturn 3 times, Hyperion orbits 4 times. So, from Titan, Hyperion would appear to describe a complete cycle every 11 days and 22.5 hours (in Earth terms). So, there are two measures, one of 15 days + 22 hours and another that is 11 days + 22.5 hours. You could still, of course, use your Earth watch and calculate time according to how it passes “back home.” Be prepared, though, for the younger generation to roll their eyes at how old planet you are.

Martian Calendars

In spite of the fact that we have had a presence on Mars for only a few decades, several people have developed calendars for marking Martian time. Check out the Mars Calendar from the Institute for Advanced Physics at http://www.iapweb.org/MartianCalendar.
